

Digitization with Android Enterprise:

A game-changer for your frontline

Frontline workers are the cornerstone of a successful organization. They can make or break the customer experience and without them business would grind to a halt. But, despite their importance, they simply don't get the same technological support as their knowledge worker counterparts. In fact, only 35% of deskless workers said they received additional technology to complete their jobs during the global pandemic.¹

A well-enabled frontline creates a series of serious business advantages.

Mobile technology is a catalyst. When your frontline workers have the right tools, they are equipped to transform your business in a multitude of ways. Accelerating digitization gives employees the ability to improve the customer experience, positively impact brand loyalty, and improve overall operations—all while saving your company money. Your frontline will also be happier, less frustrated by technology, and less likely to come up with their own workarounds using unmanaged apps that could open your organization up to a security breach. Digitizing your frontline is not only good for your people, it is good for your business too.
